1 Definition

In one dimension, we consider an interval $\lambda \in I = [-1, 1]$. A partition of I is a set of $N + 1$ nodes, $\lambda_0, \lambda_1, \lambda_2, \dots, \lambda_N$, that satisfy

$$(1) \quad -1 = \lambda_0 < \lambda_1 < \lambda_2 < \dots < \lambda_N = 1.$$

And, in this series of assignments, we will only use the Gauss-Lobatto nodes to define this partition. Given N , the function that computes the $N + 1$ Gauss-Lobatto nodes which form a partition, i.e., satisfy (1), will be provided. You can find it at the main page of this course (see footnote) or just click on  `Gauss_Lobatto_nodes.py`.

Over this partition, we can construct the well-known Lagrange polynomials in I as,

$$l^i(\lambda) = \prod_{j=0, j \neq i}^N \frac{\lambda - \lambda_j}{\lambda_i - \lambda_j}, \quad i \in \{0, 1, \dots, N\}.$$

These $N + 1$ polynomials are of a degree N . It is clear that these Lagrange polynomials satisfy the following nodal Kronecker delta property,

$$(2) \quad l^i(\lambda_j) = \delta_j^i = \begin{cases} 1, & \text{if } i = j \\ 0, & \text{else} \end{cases}, \quad i, j \in \{0, 1, \dots, N\}.$$

For an example of Lagrange polynomials, see Fig. 1.

¹https://mathischeap.com/contents/teaching/advanced_numerical_methods/mimetic_spectral_element_method/main

Fig. 1: An example of Lagrange polynomials at $N = 4$. It is clear that the Kronecker delta (2) is satisfied by these polynomials. The gray vertical lines indicate the nodes of the partition.

Assignment 0.1.0: Lagrange polynomials

Program function in Python which compute the Lagrange polynomials. The format of the function should be as follows.

```

1  def Lagrange_polynomials(nodes, lamb):
2      """Compute the Lagrange polynomials.
3
4      Parameters
5      -----
6      nodes : 1d np.ndarray
7          The partition of the interval I. It should be a 1d array of shape (m, ).
8          For example, nodes = np.array([-1, -0.8, -0.3, 0.3, 0.8, 1]).
9      lamb : 1d np.ndarray
10         The coordinates we evaluate the Lagrange polynomials. It should be a 1d
11         array of shape (n, ). For example, lamb = np.linspace(-1, 1, 100).
12
13     Returns
14     -----
15     values : 2d np.ndarray
16         It is a 2d array of shape (m+1, n). For example, values[0,:] represents
17         first Lagrange polynomial evaluated on "lamb".
18
19     """

```

Assignment 0.1.1: Visualization of Lagrange polynomials

Visualize Lagrange polynomials using the plot function of matplotlib.

```

1  >>> import matplotlib

```

The edge polynomials $e^i(\lambda)$ are linear combinations of derivatives of Lagrange Polynomials,

$$e^i(\lambda) := \sum_{j=i}^N \frac{dl^j(\lambda)}{d\lambda} = - \sum_{j=0}^{i-1} \frac{dl^j(\lambda)}{d\lambda}, \quad i \in \{1, 2, \dots, N\}.$$

Edge polynomials are of a degree $N - 1$. And they satisfy an integral Kronecker delta property,

$$(3) \quad \int_{\lambda_{j-1}}^{\lambda_j} e^i(\lambda) d\lambda = \delta_j^i = \begin{cases} 1, & \text{if } i = j \\ 0, & \text{else} \end{cases}, \quad i, j \in \{1, 2, \dots, N\}.$$

Fig. 2: An example of edge polynomials at $N = 4$. One can prove that the Kronecker delta (3) is satisfied by these polynomials. As an example, the edge polynomial $e^2(\lambda)$, i.e. the orange line, satisfies $\int_{\lambda_1}^{\lambda_2} e^2(\lambda) d\lambda = 1$ and $\int_{\lambda_{i-1}}^{\lambda_i} e^2(\lambda) d\lambda = 0$ if $i \in \{1, 3, 4\}$.

Assignment 0.2.0: Edge polynomials

Program function in Python which compute the edge polynomials. The format of the function should be as follows.

```

1  def edge_polynomials(nodes, lamb):
2      """Compute the edge polynomials.
3
4      Parameters
5      -----
6      nodes : 1d np.ndarray
7          The partition of the interval I. It should be a 1d array of shape (m, ).
8          For example, nodes = [-1, -0.8, -0.3, 0.3, 0.8, 1].
9      lamb : 1d np.ndarray
10         The coordinates we evaluate the edge polynomials. It should be a 1d array
11         of shape (n, ). For example, lamb = np.linspace(-1, 1, 100).
12
13     Returns
14     -----
15     values : 2d np.ndarray
16         It is a 2d array of shape (m, n). For example, values[0,:] represents
17         first edge polynomial evaluated on "lamb".
18
19     """

```

Assignment 0.2.1: Visualization of edge polynomials

Visualize edge polynomials using the plot function of matplotlib.

```

1  >>> import matplotlib

```

2 Reduction & reconstruction

The Lagrange polynomials are linearly independent. That is saying, recall the idea of linear (or vector) space in linear algebra, they as basis functions can form a base of a linear space. Let $\mathbf{L}$ denote the linear space they span, i.e.

$$\mathbf{L} := \text{span} (l^0, l^1, \dots, l^N).$$

Let p be a C^1 continuous function on I . We now can project p onto a polynomial $p_h \in \mathbf{L}$ as

$$(4) \quad p_h(\lambda) = \sum_{i=0}^N \mathbf{p}_i l^i(\lambda),$$

where

$$(5) \quad \mathbf{p}_i = p(\lambda_i) \quad i \in \{0, 1, \dots, N\}.$$

And, according to the Kronecker delta property (2), we also know that

$$\mathbf{p}_i = p_h(\lambda_i), \quad i \in \{0, 1, \dots, N\},$$

where $\mathbf{p}_i$ are usually called the expansion coefficients or degrees of freedom (DoF's). In linear algebra, $\mathbf{p}_0, \mathbf{p}_1, \dots, \mathbf{p}_N$ are called the coordinates of p_h under the base $(l^0, l^1, \dots, l^N)$.

The process of computing the expansion coefficients, i.e., (5), is called *reduction*, denoted by $\mathcal{I}$. And process of making p_h using the expansion coefficients and the basis functions is called *reconstruction*, denoted by $\mathcal{R}$. The *projection* operator, π , is defined as

$$\pi = \mathcal{R} \circ \mathcal{I},$$

i.e., the process of reduction and reconstruction together: $p \xrightarrow{\pi} p_h$.

The edge polynomials are also linearly independent. And we use $\mathbf{E}$ to denote the linear space

$$\mathbf{E} := \text{span} (e^1, e^2, \dots, e^N).$$

Let q be another C^0 continuous function on I . We can project q onto a polynomial $q_h \in \mathbf{E}$ as

$$(6) \quad q_h(\lambda) = \sum_{i=1}^N \mathbf{q}_i e^i(\lambda),$$

where the expansion coefficients are

$$(7) \quad \mathbf{q}_i = \int_{\lambda_{i-1}}^{\lambda_i} q(\lambda) d\lambda, \quad i \in \{1, 2, \dots, N\}.$$

Equations (6) and (7) defines reconstruction and reduction for the space $\mathbf{E}$, respectively. According to the Kronecker delta property (3), we also know that the expansion coefficients satisfy

$$\mathbf{q}_i = \int_{\lambda_{i-1}}^{\lambda_i} q_h(\lambda) d\lambda, \quad i \in \{1, 2, \dots, N\}.$$

It is seen that either the Lagrange polynomial space $\mathbf{L}$ or the edge polynomial space $\mathbf{E}$ looks regular. The special thing is the connection between them as we will see now. Assume q is the

derivative of p , i.e.,

$$q(\lambda) = p'(\lambda) = \frac{dp(\lambda)}{d\lambda}.$$

Then we will have that

$$(8) \quad q_h(\lambda) = p'_h(\lambda) = \frac{dp_h(\lambda)}{d\lambda},$$

which is saying the projection operator commute with the derivative operator. In other words, we can first perform the derivative then do the projection. The output is same to that of a projection followed by a derivative.

Now, in more details, (8) is

$$\sum_{i=1}^N \mathbf{q}_i e^i(\lambda) = \frac{d \left(\sum_{i=0}^N \mathbf{p}_i l^i(\lambda) \right)}{d\lambda},$$

see (4) and (6). In this equation, the Lagrange polynomials and edge polynomials are known. The point of interest is the relation between the expansion coefficients: how to relate $\mathbf{p}_i$ to $\mathbf{q}_i$. Without a proof, we give the following conclusion:

$$\mathbf{q}_i = \mathbf{p}_i - \mathbf{p}_{i-1}, \quad i \in \{1, 2, \dots, N\}.$$

If we put the expansion coefficients in column vectors,

$$\vec{p} = \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \\ \vdots \\ \mathbf{p}_N \end{bmatrix}, \quad \vec{q} = \begin{bmatrix} \mathbf{q}_1 \\ \mathbf{q}_2 \\ \vdots \\ \mathbf{q}_N \end{bmatrix},$$

we will find an $N \times (N + 1)$ matrix $\mathbb{E}$, called incidence matrix,

$$\mathbb{E} = \begin{bmatrix} -1 & 1 & 0 & 0 & 0 & \cdots & 0 & 0 & 0 \\ 0 & -1 & 1 & 0 & 0 & \cdots & 0 & 0 & 0 \\ 0 & 0 & -1 & 1 & 0 & \cdots & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 1 & \cdots & 0 & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \ddots & \vdots & \vdots & \\ 0 & 0 & 0 & 0 & \cdots & -1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & \cdots & 0 & -1 & 1 & 0 \\ 0 & 0 & 0 & 0 & \cdots & 0 & 0 & -1 & 1 \end{bmatrix},$$

that satisfies

$$(9) \quad \vec{q} = \mathbb{E} \vec{p}.$$

Now, we can see that, once we are given a function in $\mathbf{L}$, to compute its derivative, we just need to apply the incidence matrix $\mathbb{E}$ to the vector of its expansion coefficients. And the output will be the expansion coefficients of its derivative in space $\mathbf{E}$.

Assignment 0.3.0: Projection of Lagrange polynomial space

You need to program two functions, the first one does the reduction and the second one does the reconstruction.

```
1 def Lagrange_space_reduction(nodes, func):
```

```

2      """Reduce the function "func" to Lagrange polynomial space defined over
3      "nodes".
4
5      Parameters
6      -----
7      nodes : np.ndarray
8          The partition of the interval I. It should be a 1d array of shape (m, ).
9          For example, nodes = [-1, -0.8, -0.3, 0.3, 0.8, 1].
10
11     func :
12         The C1 smooth function to be reduced to the Lagrange polynomial space.
13
14     Returns
15     -----
16     expansion_coefficients : np.ndarray
17         A 1d array of shape (m+1,) that contains the expansion coefficients.
18
19     """
20
21     def Lagrange_space_reconstruction(nodes, expansion_coefficients, lamb):
22         """Reconstruct the polynomial in the Lagrange polynomial space over "lamb".
23
24         Parameters
25         -----
26         nodes : np.ndarray
27             The partition of the interval I. It should be a 1d array of shape (m, ).
28             For example, nodes = [-1, -0.8, -0.3, 0.3, 0.8, 1].
29         expansion_coefficients : np.ndarray
30             A 1d array of shape (m+1, ) that contains the expansion coefficients.
31         lamb : np.ndarray
32             The coordinates we evaluate the polynomial. It should be a 1d array of
33             shape (n, ). For example, lamb = np.linspace(-1, 1, 100).
34
35         Returns
36         -----
37         reconstructed_values : np.ndarray
38             A 1d array of shape (n, ) that represents the reconstructed values at
39             "lamb".
40
41         """

```

Assignment 0.3.1: Projection of edge polynomial space

You need to program two functions, the first one does the reduction and the second one does the reconstruction. *Tip: You can use the numerical integration function from scipy package (see `scipy.integrate`) for the integration.*

```

1     def edge_space_reduction(nodes, func):
2         """Reduce the function "func" to edge polynomial space defined over "nodes".
3
4         Parameters
5         -----
6         nodes : np.ndarray
7             The partition of the interval I. It should be a 1d array of shape (m, ).
8             For example, nodes = [-1, -0.8, -0.3, 0.3, 0.8, 1].
9
10        func :
11            The function to be reduced to the edge polynomial space.

```

```

10
11     Returns
12     -----
13     expansion_coefficients : np.ndarray
14         A 1d array of shape (m, ) that contains the expansion coefficients.
15
16     """
17
18     def edge_space_reconstruction(nodes, expansion_coefficients, lamb):
19         """Reconstruct the polynomial in the edge polynomial space over "lamb".
20
21         Parameters
22         -----
23         nodes : np.ndarray
24             The partition of the interval I. It should be a 1d array of shape (m, ).
25             For example, nodes = [-1, -0.8, -0.3, 0.3, 0.8, 1].
26         expansion_coefficients : np.ndarray
27             A 1d array of shape (m, ) that contains the expansion coefficients.
28         lamb : np.ndarray
29             The coordinates we evaluate the polynomial. It should be a 1d array of
30             shape (n, ). For example, lamb = np.linspace(-1, 1, 100).
31
32         Returns
33         -----
34         reconstructed_values : np.ndarray
35             A 1d array of shape (n, ) that represents the reconstructed values at
36             "lamb".
37
38         """

```

Assignment 0.3.2: Compute derivative with incidence matrix

You need to program a function to compute the incidence matrix first. Then you can play with the incidence matrix to verify (9).

```

1     def incidence_matrix_1d(nodes):
2         """Compute the incidence matrix.
3
4         Parameters
5         -----
6         nodes : np.ndarray
7             The partition of the interval I. It should be a 1d array of shape (m, ).
8             For example, nodes = [-1, -0.8, -0.3, 0.3, 0.8, 1].
9
10        Returns
11        -----
12        incidence_matrix: np.ndarray
13            A 2d array of shape (m, m+1) that represents the incidence matrix.
14
15        """

```

3 Literature revisit

To understand Lagrange polynomials and edge polynomials from more angles, we refer to the original paper [1] where they are introduced.
